Title: Zeros and Ones to ATGC's

## **Description:**

We will evaluate and improve the methods of storing binary data as DNA sequences. This includes evaluating the differences in compression order on performance. For instance:

```
Compress data \rightarrow encode \rightarrow store as DNA Or Data \rightarrow encode \rightarrow compress \rightarrow store
```

Specifically, our dataset will be from a video file to determine if the video quality is maintained after encoding and decoding using our compression methods.

# Papers:

- DNA Fountain enables a robust and efficient storage architecture, Erlich and Zielinski (2017). <a href="http://science.sciencemag.org/content/355/6328/950">http://science.sciencemag.org/content/355/6328/950</a>
- 2. Boiler: lossy compression of RNA-seq alignments using coverage vectors (2016). https://academic.oup.com/nar/article/44/16/e133/2460171
- 3. Large-scale compression of genomic sequence databases with the Burrows–Wheeler transform (2012). <a href="https://academic.oup.com/bioinformatics/article/28/11/1415/266914">https://academic.oup.com/bioinformatics/article/28/11/1415/266914</a>

### Datasets:

https://commons.wikimedia.org/wiki/File:DNA\_packing.theora.ogv (maybe more videos if time permits)

### **Access to MARCC:**

Not sure how this works, but would we be able to have access *just in case*? We are not sure if we will need it, but we may.
